TRANSMITTAL LETTER FOR RESPONSE/AMENDMENT

Sir:

Transmitted herewith is/are the following in the above-identified application:

- (X) Response/Amendment () Petition to extend time to respond
() New fee as calculated below () Supplemental Declaration
(X) No additional fee (Address envelope to "Box Non-Fee Amendments")
() Other: _____ (fee \$ _____)

CLAIMS AS AMENDED BY OTHER THAN A SMALL ENTITY						
(1) FOR	(2) CLAIMS REMAINING AFTER AMENDMENT	(3) NUMBER EXTRA	(4) HIGHEST NUMBER PREVIOUSLY PAID FOR	(5) PRESENT EXTRA	(6) RATE	(7) ADDITIONAL FEES
TOTAL CLAIMS	29	MINUS	45	= 0	X \$18	\$ 0

Title: BIOPOLYMER ARRAYS AND THEIR FABRICATION

Commissioner for Patents
Washington, D.C. 20231

Dear Sir:

AMENDMENT AND RESPONSE

Please amend the present application by canceling claims 53, 54 and amending the claims as indicated in the attached APPENDIX. In accordance with 37 CFR 1.121(c)(3) a clean copy of all of the claims as now pending is below:

1. (PREVIOUSLY AMENDED) A method of fabricating an addressable array of biopolymer probes on a substrate according to a target array pattern using a deposition apparatus which, when operated according to a target drive pattern based on nominal operating parameters of the apparatus, provides the probes on the substrate in the target array pattern, the method comprising:
 - (a) examining at least one operating parameter for an error from a nominal value which error will result in use of the target drive pattern producing a discrepancy between the target array pattern and an actual array pattern deposited;

- (b) when an error is detected deriving, based on the error, a corrected drive pattern different from the target drive pattern such that use of the corrected drive pattern results in a reduced discrepancy between the target and actual array patterns; and
- (c) operating the deposition apparatus according to the corrected drive pattern so as to fabricate the array.

2. A method according to claim 1, additionally comprising operating the deposition apparatus according to the corrected drive pattern.
3. A method according to claim 1 wherein the probes are DNA or RNA probes.
4. A method according to claim 1 additionally comprising saving the target drive pattern in a memory of the deposition apparatus.
5. A method according to claim 1 additionally comprising saving the target drive pattern in a memory of the deposition apparatus, and wherein the corrected drive pattern is saved in the memory.
6. A method according to claim 1 wherein the corrected drive pattern is derived without obtaining a target drive pattern.
7. (PREVIOUSLY AMENDED) A method according to claim 4 wherein:
the deposition apparatus includes a dispensing head to dispense fluid droplets containing the probes or probe precursors, and a transport system to move at least one of the dispensing head and substrate relative to the other as the droplets are dispensed from the head, so as to form the array; and
the corrected drive pattern controls operation of the transport system.
8. (PREVIOUSLY AMENDED) A method according to claim 1 wherein:
the deposition apparatus includes a dispensing head to dispense fluid droplets containing the probes or probe precursors, and a transport system to move at least one

of the dispensing head and substrate relative to the other as the droplets are dispensed from the head, so as to form the array;

the target drive pattern controls operation of the transport system; and

the operating parameter is the position of the substrate or dispensing head, which is examined by viewing the substrate or dispensing head.

9. A method according to claim 8 wherein the operating parameter is examined by viewing a fiducial mark on the dispensing head or substrate

10. A method according to claim 1 wherein:

the deposition apparatus includes a dispensing head with multiple nozzles to dispense fluid droplets containing the probes or probe precursors, and a transport system to move at least one of the dispensing head and substrate relative to the other as the droplets are dispensed from the head, so as to form the array;

the drive pattern controls operation of the transport system;

the operating parameter is the position of the substrate or dispensing head, or orientation of a nozzle, and is examined by viewing the substrate, dispensing head, or nozzle, or a droplet pattern previously dispensed from the head.

11. A method according to claim 7 additionally comprising saving the target drive pattern in a memory of the deposition apparatus, and wherein the corrected drive pattern is saved in the memory, prior to operating the dispensing head and transport system to form the array.

12. A method according to claim 7 additionally comprising saving the target drive pattern in a memory of the deposition apparatus, and wherein the corrected drive pattern is derived by modifying, based on the detected error, instructions to at least one deposition apparatus component based on the target drive pattern during operation of the dispensing head and transport system to form the array.

13. A method according to claim 1 wherein the at least one parameter is the position of the substrate in the deposition apparatus.

14. A method according to claim 7 wherein the at least one parameter is a position of the dispensing head.

B1
15. (TWICE AMENDED) A method according to claim 7 wherein the deposition apparatus further includes a position encoder to detect the position of the dispensing head or the substrate, and wherein the at least one parameter is an accuracy of the encoder to detect the position of the dispensing head or substrate.

B2
16. (AMENDED) A method according to claim 7 wherein the at least one parameter is the accuracy of the transport system to move the substrate to an expected location in response to a command.

17. A method according to claim 7 wherein the dispensing head has multiple droplet dispensing nozzles, and wherein the at least one parameter is a position of a nozzle.

18. (PREVIOUSLY AMENDED) A method of fabricating an addressable array of biopolymer probes on a substrate according to a target array pattern using a deposition apparatus which, when operated according to a target drive pattern based on nominal operating parameters of the apparatus and which is stored in a memory of the deposition apparatus, provides the probes on the substrate in the target array pattern, the method comprising:

when an error from a nominal value exists in at least one operating parameter, which error will result in use of the target drive pattern producing a discrepancy between the target array pattern and an actual array pattern deposited then deriving, based on the error, a corrected drive pattern from the target drive pattern such that use of the corrected drive pattern results in a reduced discrepancy between the target and actual array patterns; and

operating the deposition apparatus according to the corrected drive pattern so as to fabricate the array. .

19. A method according to claim 18 wherein the corrected drive pattern is saved in the memory.

B3

46. (AMENDED) A method according to claim 1 wherein:
the deposition apparatus includes a dispensing head to dispense fluid droplets containing the probes or probe precursors, and a transport system to move at least one of the dispensing head and substrate relative to the other as the droplets are dispensed from the head, so as to form the array;
the drive pattern controls operation of the transport system; and
the at least one parameter is an accuracy of the transport system to move the substrate or head to an expected location in response to a command.

47. (AMENDED) A method according to claim 46 wherein the at least one operating parameter is an accuracy of the transport system to move the substrate or head along a corresponding nominal axis of movement.

48. (AMENDED) A method according to claim 46 wherein the at least one operating parameter is an accuracy of the transport system to move the substrate to an expected location in response to a command.

49. A method according to claim 1 wherein the operating parameter is a fluid volume dispensed by the deposition apparatus.

B4
Sub C7 } 50. (AMENDED) A method according to claim 1 wherein the operating parameter is a position of a component which varies due to thermal expansion.

51. A method according to claim 1 wherein:

the deposition apparatus includes a dispensing head to dispense fluid droplets containing the probes or probe precursors, and a transport system to move at least one of the dispensing head and substrate relative to the other as the droplets are dispensed from the head, so as to form the array;

the apparatus further includes an encoder to provide data on the location of the substrate or head; and

the at least one operating parameter is an encoder error.

52. A method according to claim 1 wherein:

the deposition apparatus includes a dispensing head with multiple nozzles to dispense fluid droplets containing the probes or probe precursors, and a transport system to move at least one of the dispensing head and substrate relative to the other as the droplets are dispensed from the head, so as to form the array;

the drive pattern controls operation of the transport system;

the operating parameter is the position of the dispensing head, or orientation of a nozzle, and is examined by viewing the dispensing head, or nozzle.

55. A method according to claim 49 wherein the deposition apparatus comprises multiple jets for dispensing droplets, and wherein the corrected drive pattern comprises an instruction to switch to a different jet when a deviation from nominal volume is encountered for one jet which is more than a predetermined tolerance.

B5
Sub
C9
56. (NEW) A method according to claim 1 wherein the same error affects less than all of the array features.

57. (NEW) A method according to claim 14 wherein the same error affects less than all of the array features.
